

Amendment to the Abstract:

The Abstract has been amended. A revised Abstract is attached.

ABSTRACT

~~Whereas in a conventional circularly polarized wave antenna, the patch antenna construction method is complicated and radiation is limited to upward area where a patch antenna is installed with respect to a ground pattern, a~~ circularly polarized wave antenna according to the invention is an antenna having two or more electrically conductive elements and a high frequency circuit, wherein at least two of the plurality of electrically conductive elements are constructed in V-shape with an angle of 90 degrees; therefore, it is possible to realize a circularly polarized wave antenna of simple construction having directivity gains in multi-direction.

ABSTRACT

A circularly polarized wave antenna is an antenna having two or more electrically conductive elements and a high frequency circuit, wherein at least two of the plurality of electrically conductive elements are constructed in V-shape with an angle of 90 degrees; therefore, it is possible to realize a circularly polarized wave antenna of simple construction having directivity gains in multi-direction.
